

# Vendor Abandonment Recovery: What the Engineer Sees, What Gets Built, What Ships.

Founder, NIVERO · Gilbert Nordelus

## PROOF OF PERFORMANCE

## WHAT THE CODEBASE IS ACTUALLY TELLING YOU

### THE DIAGNOSIS

Three missed check-ins is not a communication failure. It is an early structural signal — and the failure modes are already written into the code. AI-assisted dependency mapping reconstructs broken build chains, surfaces, hard-coded environment configs, and identifies permission conflicts across every service layer.

**Failure modes identified before a single line is rewritten.**

### THE REBUILD

CI/CD pipelines rebuilt with automated rollback from the first commit. Containerized Kubernetes deployment with cognitive load monitoring active before the first production push.

Top-down refactor using AI-assisted static analysis. Predictive regression testing surfaces root-cause chains manual QA missed.

**System rebuilt to hold at scale — not patched to hold until next quarter.**

## KEY DELIVERABLES

### TECHNICAL RECOVERY

- AI-based dependency mapping and rebuild
- Automated rollback and self-healing pipelines
- Kubernetes containerization + cognitive load monitoring
- Root cause documentation and evidence package
- Canary deployment + rollback-safe pipeline
- Regression suite + chaos engineering validation

### COMMERCIAL PROTECTION

- White-label delivery under NDA throughout
- Every output carries your name — commits, builds, release notes
- Root cause documented for client-facing debrief
- Board-ready milestone documentation for startups
- Incident command structure established within hours
- Evidence package built for the client conversation

## CLIENT TESTIMONY

*"NIVERO performed invisibly and flawlessly. Our client never knew there was a crisis — they only saw success."*

— COO, National Advertising Agency

*"When the work becomes overwhelming, it is beneficial to have a partner with the qualities that this team possesses."*

— M.C., Project Manager, National Marketing Agency

## N E X T S T E P S

The assessment starts the same day. Senior engineers only — no ramp time, no juniors. One call establishes whether the failure signal in the codebase is recoverable in the remaining window.
